“ You can't leave your fingerprints on this stainless steel! . . .

Fact: - traditional stainless steel appliances fingerprint easily because their metal is exposed. And, as often as we open our refrigerators – that's a lot of wiping - just for a premium look -

Now there's a new alternative to get the prestige of stainless - without its fingerprinting headache -

- Stainless Steel Paint . . .

Thomas' Kitchen Art, of St. Louis, Missouri, a producer of specialty pigments for clients such as the US Navy -

claims to have developed the world's first brush on stainless steel paint to upgrade any fridge, range or dishwasher -

- into a 'fingerprint-free stainless steel appliance -

The company says they've chemically encased 100% micronized stainless steel particles into an automotive-grade polymer.

They claim the process is designed for the Do-It-Yourselfer and takes the beginning painter about four hours to apply, and eight hours to dry – so it's a weekend project to upgrade your entire kitchen to their smudge-free stainless.

The stainless steel paint comes in two sizes – a “Range & Dishwasher” Kit and a “Fridge” Kit, and retails in stores or online for \$19.95 and \$49.95 respectively. Both are backed with a 100% satisfaction guarantee.

In closing, according to Thomas' Kitchen Art, families now have a better way to enjoy the modern feel of stainless steel appliances - without the hassle of fingerprints.

###
